DNS Shield Home AI

The Smart Guardian of the Connected Home

Connect. Protect. Control.

1 · The problem

Homes got smart — and **vulnerable**.

- **45%** of smart homes in Brazil have ≥1 vulnerable device
- **66%** of home routers are at risk
- The targets: **cameras, TVs, assistants, printers, IoT** — on 24/7

> The danger isn't only the computer. It's everything that stays "always on".

2 · The insight

In the **physical** home, you notice when something's wrong.
In the **digital** home, you don't.

Current tools show: `logs`, `IPs`, `ports`, `DNS`, `alerts`.
And nobody understands that.

> The problem isn't a lack of information.
> It's a lack of **interpretation**.

3 · The solution — AI First

DNS Shield Home AI

An appliance with **local AI** that watches the network and **translates** it into human language.

Competitors show	We say
`192.168.0.105`	"A new device joined your network 15 min ago."
`Blocked Request`	"We blocked a connection to a suspicious site."
`Firmware Outdated`	"A device is outdated and more vulnerable."

Setup: **plug in → join the "DNS-Shield" Wi-Fi → done.**
No router changes. No technician.

4 · Real privacy (the differentiator)

We don't read messages. We don't read e-mail. We don't listen to conversations.
We analyze **only network behavior**.

- **Local AI (Llama)** — runs inside the home
- **Data stays in the house** — no mandatory cloud
- **Intelligence flows down; customer data never flows up**
- No data selling. No invasive monitoring.

> "We can't violate privacy with data we never receive."

5 · Competition & Business

	Pi-hole	NextDNS	Firewalla	Home AI
Natural language	❌	❌	❌	✅
Local AI	❌	❌	❌	✅
Privacy by default	⚠️	⚠️	⚠️	✅
Zero config / families	❌	❌	⚠️	✅

Model: hardware **R$ 699** (one-time) + recurring add-ons:

Remote (secure remote access) · Care (SLA support) · Extended updates.

The data stays the customer's.

6 · Roadmap, vision & the ask

MVP in 6 weeks (1 AI + 1 full stack) · **Beta**: 10 homes in 30 days.
Goal: *95% install with no human help — if they need a technician, we failed.*

Today we protect the network. Tomorrow we answer:
"Is my home safe? What changed? Is there a device I don't recognize?"

> Most companies use AI to **learn about the user**.
> We use AI so the **user understands their own technology**.

DNS Shield Home AI — the guardian that was missing. 🛡️

Data source

Vulnerability stats: **Avast** — study of 2M+ Brazilian home networks (45% of smart homes with ≥1 vulnerable device; 66% of routers at risk). *Content rephrased for license compliance*.
